

Figure 10 is a plot showing the ratio of the number of detected events to the total number of events, $N_{\text{det}}/N_{\text{tot}}$, as a function of the annealing phase. The y-axis ranges from 1.0 to 2.6. The x-axis shows various annealing phases: bef_ann, ann_75C_5h, ann_75C_25h, ann_100C_5h, ann_100C_25h, ann_125C_5h, ann_125C_25h, ann_150C_5h, and ann_150C_25h. Data points are shown with error bars representing statistical uncertainty (black) and systematic uncertainty (purple). The ratio is generally around 1.7, with a notable increase for ann_75C_25h and ann_100C_5h.

Figure 10 is a plot showing the evolution of the ratio of the number of particles in the annihilation phase to the total number of particles, R_{16}/R_{24} , as a function of time. The y-axis ranges from 0.8 to 2.8. The x-axis shows time steps: bef_ann, ann_75C_5h, ann_75C_25h, ann_100C_5h, ann_100C_25h, ann_125C_5h, ann_125C_25h, ann_150C_5h, and ann_150C_25h. Two data series are shown: 'Statistical uncertainty' (black error bars) and 'Systematic uncertainty (R16/R24)' (purple error bars). The ratio starts at approximately 2.4 for 'bef_ann' and decreases to about 1.1 for 'ann_75C_25h'. The 'ann_75C_25h' point has a large vertical spread, indicating high uncertainty. The ratio remains relatively stable around 1.1 for subsequent time steps.
